Artificial Intelligence in Design '92 Mar 12 2021 Design has now become an important research topic in engineering and architecture. Design is one of the keystones to economic competitiveness and the fundamental precursor to manufacturing. The development of computational models founded on the artificial intelligence paradigm has provided an impetus for current design research. This volume contains contributions from the Second International Conference on Artificial Intelligence in Design held in June 1992 in Pittsburgh. They represent the state-of-the-art and the cutting edge of research and development in this field. They are of particular interest to researchers, developers and users of computer systems in design. This volume demonstrates both the breadth and depth of artificial intelligence in design and points the way forward for our understanding of design as a process and for the development of computer-based tools to aid designers.

Competition, Innovation and the Microsoft Monopoly: Antitrust in the Digital Marketplace Feb 20 2022 Do the antitrust laws have a place in the digital economy or are they obsolete? That is the question raised by the government's legal action against Microsoft, and it is the question this volume is designed to answer. America's antitrust laws were born out of the Industrial Revolution. Opponents of the antitrust laws argue that whatever merit the antitrust laws may have had in the past they have no place in a digital economy. Rapid innovation makes the accumulation of market power practically impossible. Markets change too quickly for antitrust actions to keep up. And antitrust remedies are inevitably regulatory and hence threaten to 'regulate business'. A different view - and, generally, the view presented in this volume - is that antitrust law can and does have an important and constructive role to play in the digital economy. The software business is new, it is complex, and it is rapidly moving. Analysis of market definition, contestibility and potential competition, the role of innovation, network externalities, cost structures and marketing channels present challenges for academics, policymakers and judges alike. Evaluating consumer harm is problematic. Distinguishing between illegal conduct and brutal - but legitimate - competition is often difficult. Is antitrust analysis up to the challenge? This volume suggests that antitrust analysis 'still works'. In stark contrast to the political rhetoric that has surrounded much of the debate over the Microsoft case, the articles presented here suggest neither that Microsoft is inherently bad, nor that it deserves a de facto exemption from the antitrust laws. Instead, they offer insights - for policymakers, courts, practitioners, professors and students of antitrust policy everywhere - on how antitrust analysis can be applied to the business of making and marketing computer software.

Competition Policy Analysis Mar 24 2022 As markets become increasingly integrated and globalised, competition policy is facing new challenges. Contributions from leading international experts explore theoretical and methodological issues of practical relevance for the new competition policy order and give examples of practical policy adjustments.

History of Computer Graphics Aug 24 2019 This book reflects the many changes that computer graphics technology has undergone in my working life time. I graduated from a teachers college in 1963. There was not a computer of any kind on campus, imagine my shock when my very first college employer (Omaha University) required me to know something about an IBM 1620 and a key punch machine! The first part of this book is an account of that experience at Omaha University and later the Nebraska of Nebraska at Omaha. When I moved to Clemson University in 1976, they had a computer and a large Calcomp Plotter but nothing else in the way of computer graphics hardware or software. So, except for a few short sections in chapter one, this history begins with the events of 1963 and proceeds to document what happened to computer graphics for engineering design and manufacturing as practiced by an engineer or technician at Clemson University. The next section of the book contains my experiences as a self-employed consultant (1993-present), my consulting started in 1984 after I completed a PhD in Data Systems Engineering. In 1993, I left full time teaching and became Professor Emeritus at Clemson University. I wanted to start my own consulting company, DLR Associates. Oddly enough, most of my first consulting in computer graphics took place in the Omaha and Pennsylvania areas - not South Carolina. My contacts came from my paper presentations at various ASEE meetings and the annual national distance learning conferences held at the University of Maine. I took a year off to accept a Fulbright Scholarship Nomination from the University of Rookee, India. I was listed as an international member in the Who's

Who Directory of the computer graphics industry. In a nut shell, that is who I am. Why, then, did I decide to write this book?
