She's never stopped needing him, and when a black witch curses the pack, she wonders if she'll even survive. It's a poison of the blood, and with each bite, the virus spreads, leaving the infected rabid and under the control of an evil Alpha. Kyle Benton is starting over. He's a lone wolf, betrayed by the only woman he's ever loved. Until Emma barges back into his life, as gorgeous and determined as ever. He's hell bent on resisting her, or at least making her suffer. But she needs him in a way that touches him to his very soul. Now he has to determine how to set her free, and if he can, how he can ever let her go. BITTEN BY TREACHERY It's not like Charly the

witch wanted to betray the Hadley werewolves. Or infiltrate the pack. But it's the only way to save her mother and protect her coven from a dark evil. She's a witch in wolf's clothing - until an unfortunate bite forces her to become the one thing she detests the most. The last time a witch came to Hadley, she almost destroyed Trenton's pack. Charly is the most intriguing woman he's ever met, and he wants to know all about her. The passion between Charly and Trenton shocks them both, but can she trust him with her secret...and her heart? One thing is for certain: she has to tell him the truth soon - before it brings about the end of both Trenton and the innocent citizens of Hadley. BITTEN BY VENGEANCE Cursed witch Nevena wants nothing more than to destroy the dark evil that has escaped her coven's compound. She's outgunned and on her own--until a band of werewolves from Hadley join in the fight. Drew is a cop bent on protecting his pack. Hadley has been attacked again, leaving him bitter and determined to do what's right. He will help the witches bring down what drove them to Hadley, but he refuses to get close to them...Until the curse on Nevena sucks him in. Drew discovers what it's like to love when Nevena traps both his heart and his soul. But he may lose them both in order to bring down the dark evil determined to destroy everything in its path.

Metallic Microlattice Structures May 14 2021 This work reviews the current state of the art in metallic microlattice structures, manufactured using the additive manufacturing processes of selective laser melting, electron beam melting, binder jetting and photopolymer wave guides. The emphasis is on structural performance (stiffness, strength and collapse). The field of additively manufactured metallic microlattice structures is fast changing and wide ranging, and is being driven by developments in manufacturing processes. This book takes a number of specific structural applications, viz. sandwich beams and panels, and energy absorbers, and a number of conventional metallic materials, and discusses the use of additive manufactured metallic microlattice structures to improve and enhance these structural performances. Structural performances considered includes such non linear effects as plasticity, material rupture, elastic and plastic instabilities, and impact loading. The specific discussions are put into the context of wider issues, such as the effects of realisation processes, the effects of structural scale, use of sophisticated analysis and synthesis methodologies, and the application of existing (conventional) structural theories. In this way, the specific discussions are put into the context of the emerging general fields of Architected (Architected) Materials and Mechanical Metamaterials.

Ultra-High Temperature Ceramics Dec 29 2019 The first comprehensive book to focus on ultra-high-temperature ceramic materials in more than 20 years Ultra-High Temperature Ceramics are a family of compounds that display an unusual combination of properties, including extremely high melting temperatures (>3000°C), high hardness, and good chemical stability and strength at high temperatures. Typical UHTC materials are the carbides, nitrides, and borides of transition metals, but the Group IV compounds (Ti, Zr, Hf) plus Ta are generally considered to be the main focus of research due to the superior melting temperatures and stable high-melting-temperature oxide that forms in situ. Rather than focusing on the latest scientific results, Ultra-High Temperature Ceramics: Materials for Extreme Environment Applications broadly and critically combines the historical aspects and the state-of-the-art on the processing, densification, properties, and performance of boride and carbide ceramics. In reviewing the historic studies and recent progress in the field, Ultra-High Temperature Ceramics: Materials for Extreme Environment Applications provides: Original reviews of research conducted in the 1960s and 70s Content on electronic structure, synthesis, powder processing, densification, property measurement, and characterization of boride and carbide ceramics. Emphasis on materials for hypersonic aerospace applications such as wing leading edges and propulsion components for vehicles traveling faster than Mach 5 Information on materials used in the extreme environments associated with high speed cutting tools and nuclear power generation Contributions are based on presentations by leading research groups at the conference "Ultra-High Temperature Ceramics: Materials for Extreme Environment Applications II" held May 13-19, 2012 in Hernestein, Austria. Bringing together disparate researchers from academia, government, and industry in a singular forum, the meeting cultivated didactic discussions and efforts between bench researchers, designers and engineers in assaying results in a broader context and moving the technology forward toward near- and long-term use. This book is useful for furnace manufacturers, aerospace manufacturers that may be pursuing hypersonic technology, researchers studying any aspect of boride and carbide ceramics, and practitioners of high-temperature structural ceramics.
